Field of the Invention

The invention relates to novel compounds that function as protein tyrosine
kinase inhibitors. More particularly, the invention relates to novel compounds that
15 function as inhibitors of c-fms kinase.

Background of the Invention

Protein kinases are enzymes that serve as key components of signal
transduction pathways by catalyzing the transfer of the terminal phosphate from ATP
20 to the hydroxy group of tyrosine, serine and threonine residues of proteins. As a
consequence, protein kinase inhibitors and substrates are valuable tools for assessing
the physiological consequences of protein kinase activation. The overexpression or
inappropriate expression of normal or mutant protein kinases in mammals has been
demonstrated to play significant roles in the development of many diseases, including
25 cancer and diabetes.

Protein kinases can be divided into two classes: those which preferentially
phosphorylate tyrosine residues (protein tyrosine kinases) and those which
preferentially phosphorylate serine and/or threonine residues (protein serine/threonine
kinases). Protein tyrosine kinases perform diverse functions ranging from stimulation
30 of cell growth and differentiation to arrest of cell proliferation. They can be classified
as either receptor protein tyrosine kinases or intracellular protein tyrosine kinases.
The receptor protein tyrosine kinases, which possess an extracellular ligand binding

domain and an intracellular catalytic domain with intrinsic tyrosine kinase activity, are distributed among 20 subfamilies.

Receptor tyrosine kinases of the epidermal growth factor ("EGF") family, which includes HER-1, HER-2/neu and HER-3 receptors, contain an extracellular
5 binding domain, a transmembrane domain and an intracellular cytoplasmic catalytic domain. Receptor binding leads to the initiation of multiple intracellular tyrosine kinase dependent phosphorylation processes, which ultimately results in oncogene transcription. Breast, colorectal and prostate cancers have been linked to this family of receptors.

10 Insulin receptor ("IR") and insulin-like growth factor I receptor ("IGF-1R") are structurally and functionally related but exert distinct biological effects. IGF-1R over-expression has been associated with breast cancer.

Platelet derived growth factor ("PDGF") receptors mediate cellular responses that include proliferation, migration and survival and include PDGFR, the stem cell
15 factor receptor (c-kit) and c-fms. These receptors have been linked to diseases such as atherosclerosis, fibrosis and proliferative vitreoretinopathy.

Fibroblast growth factor ("FGF") receptors consist of four receptors which are responsible for the production of blood vessels, for limb outgrowth, and for the growth and differentiation of numerous cell types.

20 Vascular endothelial growth factor ("VEGF"), a potent mitogen of endothelial cells, is produced in elevated amounts by many tumors, including ovarian carcinomas. The known receptors for VEGF are designated as VEGFR-1 (Flt-1), VEGFR-2 (KDR), VEGFR-3 (Flt-4). A related group of receptors, tie-1 and tie-2 kinases, have been identified in vascular endothelium and hematopoietic cells. VEGF receptors
25 have been linked to vasculogenesis and angiogenesis.

Intracellular protein tyrosine kinases are also known as non-receptor protein tyrosine kinases. Over 24 such kinases have been identified and have been classified into 11 subfamilies. The serine/threonine protein kinases, like the cellular protein tyrosine kinases, are predominantly intracellular.

30 Diabetes, angiogenesis, psoriasis, restenosis, ocular diseases, schizophrenia, rheumatoid arthritis, cardiovascular disease and cancer are exemplary of pathogenic conditions that have been linked with abnormal protein tyrosine kinase activity. Thus,

a need exists for selective and potent small-molecule protein tyrosine kinase inhibitors. U.S. Patent Nos. 6,383,790; 6,346,625; 6,235,746; 6,100,254 and PCT International Applications WO 01/47897, WO 00/27820 and WO 02/068406 are indicative of recent attempts to synthesize such inhibitors.

IV. Results

An autophosphorylation, fluorescence polarization competition immunoassay was used to determine the potency for c-fms inhibition exhibited by selected compounds of Formulae I and II. The assay was performed in black 96-well microplates (LJL BioSystems). The assay buffer used was 100 mM HEPES, pH 7.5, 1 mM DTT, 0.01 % (v/v) Tween-20. Compounds were diluted in assay buffer containing 4 % DMSO just prior to the assay. To each well, 5 μ L of compound were added followed by the addition of 3 μ L of a mix containing 33 nM c-fms (3DP) and 16.7 mM $MgCl_2$ (Sigma) in assay buffer. The kinase reaction was initiated by adding 2 μ L of 5 mM ATP (Sigma) in assay buffer. The final concentrations in the assay were 10 nM c-fms, 1 mM ATP, 5 mM $MgCl_2$, 2 % DMSO. Control reactions were ran in each plate: in positive and negative control wells, assay buffer (made 4 % in DMSO) was substituted for the compound; in addition, positive control wells received 1.2 μ L of 50 mM EDTA.

The plates were incubated at room temperature for 45 min. At the end of the incubation, the reaction was quenched with 1.2 μ L of 50 mM EDTA (EDTA was *not* added to the positive control wells at this point; see above). Following a 5-min incubation, each well received 10 μ L of a 1:1:3 mixture of anti-phosphotyrosine antibody, 10X, PTK green tracer, 10X (vortexed), FP dilution buffer, respectively (all from PanVera, cat. # P2837). The plate was covered, incubated for 30 min at room temperature and the fluorescence polarization was read on the Analyst. The instrument settings were: 485 nm excitation filter; 530 nm emission filter; Z height: middle of well; G factor: 0.93. Under these conditions, the fluorescence polarization values for positive and negative controls were approximately 300 and 150, respectively, and were used to define the 100 % and 0 % inhibition of the c-fms reaction. The reported IC_{50} values are averages of three independent measurements.

Table 1 lists representative compounds of Formulae I and II of the invention.
